**INSTRUCTIONS TO CANDIDATES**

Answer Question **ONE** and any other **THREE** questions

*This paper consists of 4 printed pages. Please turn over.*

## QUESTION ONE

a) Find the derivatives of y with respect to x:

i.  $y = \frac{(6x^5)(x^2-4)-(2x)(x^6)}{(x^2-4)^2}$

ii.  $y = 3u^{\frac{1}{2}} + u^3$        $u = x^2 + 2x^2$       **(4 mks)**

b) Given the following Marginal Propensity to Consume (MPC) function, derive the corresponding Consumption function:

$$\text{MPC} = 0.7 + 0.1Y^{-1/4}$$

And  $C = 80$  when  $Y = 0$       **(3mks)**

c) Compute the elasticity of Q with respect to P and state whether the function is elastic, inelastic or unit elastic

$$Q = \frac{2}{p^2} \quad \text{b) (3 mks)}$$

d) Discuss the limitations of Static Equilibrium Analysis      **(4 mks)**

e) Compute the following integral:

$$\int (x^{2/3} - \frac{7}{x} + 5e^{3x}) dx \quad \text{b) (3 mks)}$$

f) A national income model is represented by the following functions:

$$Y = C + I + G$$

$$C = a + bY^d$$

$$T = tY$$

$$G = G^0$$

$$I = I^0$$

Derive the following multipliers:

i. Government Expenditure Multiplier

ii. Income Tax Rate Multiplier      **(6 mks)**

g) Find the partial derivative of Z with respect to x and y

$$Z = (3x^4 + 3y^5 - y^3)^6 \quad \text{b) (2 mks)}$$

## QUESTION TWO

- a) Given Demand and Supply functions in a one-commodity market model as:

$$Q_d = a - bP$$

$$Q_s = -c + dP$$

- i. Derive the equilibrium price and quantity
- ii. Using comparative static partial derivatives, compute:
  - a. Effect of a shift of the demand function on equilibrium quantity  $(\frac{\partial Q}{\partial a})$ . Use a diagram to show an increase in the parameter a
  - b. Effect of change in the slope of the supply function on equilibrium price  $(\frac{\partial P}{\partial d})$ . Use diagram to show increase in the parameter d

**(8 marks)**

- b) Magothe has a coffee firm in Kiambu county having the following functions:

$$Q = 0.8P - 20$$

$$TFC = 180$$

$$AVC = 4 + 2Q$$

Find Magothe's profit maximizing level of output and his profit

**(7 marks)**

## QUESTION THREE

- a) Wijenje has the following maize production function

$$Q = 40K^{0.4}L^{0.6}$$

Where Q is the quantity of maize produced while K and L are units of inputs capital and labour respectively. Supposing that the prices of K and L are Ksh 20 and Ksh. 40 respectively, and that he has a total of Ksh. 5000 to spend on the two inputs:

- i. Using Lagrangean optimization technique determine the values of  $\lambda$ , K and L at profit maximization level
- ii. What will be Wijenje's maximum profit
- iii. Using bordered Hessian matrix, confirm that the critical values present a maximum

**(15 marks)**

#### QUESTION FOUR

- a) Noellene is a price discriminating monopolist having the following functions for her milk production firm:

$$P_1 = 32 - 2Q_1$$

$$P_2 = 22 - Q_2$$

$$TC = 10 + 2Q + Q^2$$

Determine the prices and quantities for the milk in the two different markets **(9 marks)**

- b) The following demand and supply functions were extracted from a perfectly competitive market

$$P = 80 - \frac{1}{2}Q \quad \text{demand function}$$

$$P = 20 + \frac{1}{10}Q \quad \text{supply function}$$

Determine Producer Surplus and Consumer Surplus at equilibrium **(6 marks)**

#### QUESTION FIVE

- a) What is the usefulness of the Lagrangean multiplier in mathematical optimization **(3 marks)**
- b) Faith has a mango firm in Kitui in which she has an objective of:

$$\text{Maximizing profit} = 60x - 2x^2 - xy - 3y^2 + 80y$$

Subject to  $x + y = 12$  as the constraint

- i. Compute the values of  $x$ ,  $y$  and  $\lambda$  at profit maximization point **(10 marks)**
- ii. What will be Faith's profit **(2 marks)**

.....END.....`
